Lab 1 warm-up

```
print("Hello World")
```

```
Hello World
```

Part B: Python warm-up

1. Variables and arithmetic:

```
# Calculate the volume of a rectangular estuary (length x width x depth)
length = 5000   # metres
width = 800     # metres
depth = 3.5     # metres
volume = length * width * depth
print(f"Estuary volume: {volume} m^3")
```

```
Estuary volume: 14000000.0 m^3
```

2. List and loops:

```
# Simulate 10 days of exponential population growth
population = 100
rate = 0.05
history = [population]

for day in range(10):
    population = population + rate * population
    history.append(round(population, 1))

print(history)
```

```
[100, 105.0, 110.2, 115.8, 121.6, 127.6, 134.0, 140.7, 147.7, 155.1, 162.9]
```

3. Functions: # Write a function that converts temperature from Celsius to Fahrenheit

```python
def celsius_to_fahrenheit(c):
    return c * 9/5 + 32

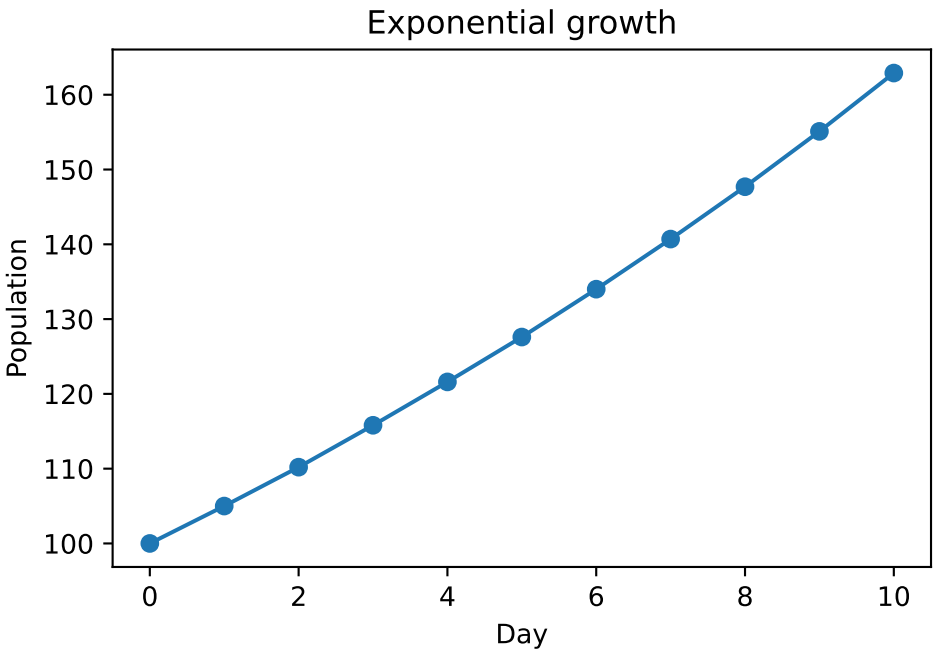
# Test it
for temp in [0, 15, 25, 37]:
    print(f"{temp}°C = {celsius_to_fahrenheit(temp)}°F")
```

```
0°C = 32.0°F
15°C = 59.0°F
25°C = 77.0°F
37°C = 98.6°F
```

Plotting:

```python
import matplotlib.pyplot as plt

days = list(range(len(history)))
plt.plot(days, history, "o-")
plt.xlabel("Day")
plt.ylabel("Population")
plt.title("Exponential growth")
plt.show()
```



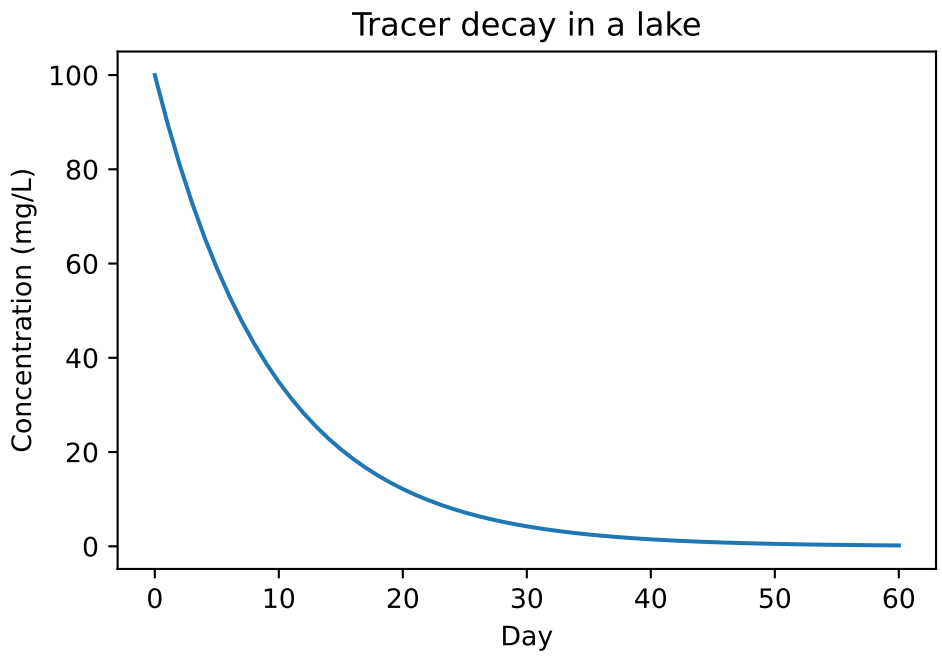
Part C: Modelling preview

```
# decay_rate = 0.1
import matplotlib.pyplot as plt

concentration = 100.0
decay_rate = 0.1
dt = 1.0
history = [concentration]

for day in range(60):
    concentration = concentration - decay_rate * concentration * dt
    history.append(concentration)

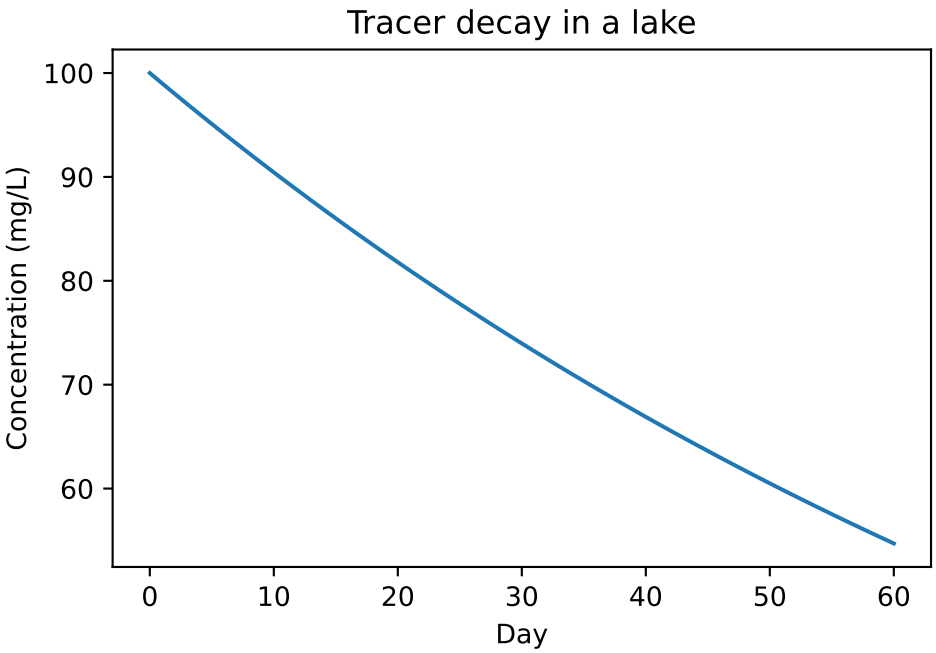
plt.plot(history)
plt.xlabel("Day")
plt.ylabel("Concentration (mg/L)")
plt.title("Tracer decay in a lake")
plt.show()
```



```
# decay_rate = 0.01
import matplotlib.pyplot as plt
concentration = 100.0
decay_rate = 0.01
dt = 1.0
history = [concentration]

for day in range(60):
    concentration = concentration - decay_rate * concentration * dt
    history.append(concentration)

plt.plot(history)
plt.xlabel("Day")
plt.ylabel("Concentration (mg/L)")
plt.title("Tracer decay in a lake")
plt.show()
```



A higher decay rate (eg.0.1) results in a faster decrease in concentration over time, while a lower decay rate (e.g 0.01) leads to a slower decrease.
